## Keeping an Eye on Cyber Security What Every Security Director and Executive Should Know

Communications via the internet, and the electronic devices used to rapidly communicate with, especially through a corporate network, has changed significantly in recent years. The communication devices have become smaller, faster, and smarter. While these technologies have created opportunities for employers, they have also created significant workplace risks. I will cover in layman's terms the types of threats that are typically found in a business/computer environment. How these threats make a business vulnerable and what's available to investigate and detect these threats. More importantly, I will describe Computer Forensics and the tools that are available so that a Security Director or corporate director can mitigate their risks and permit them to exercise their duty of care responsibilities. I will tie in the typical "What happened?" questions with issues concerning the proper way to collect, analyze, identify and present credible evidence.

David Kondrup is currently the Vice President, Strategic Initiatives at Cyber Diligence, Inc. a licensed private investigation firm that specializes in Computer Forensics and Computer Security. He is also C.E.O. of All Business Management, LLC a Long Island based consultancy that specializes in All-Hazards preparedness and strategic planning to help manage and protect businesses
